Description

SealCoffee Mobile App is a coffee shop ordering application that allows customers to browse the coffee shop menu, place orders, manage their cart, and view available beverages and food items. The application will include both a customer side and an employee side.

On the customer side, users can create an account, log in, and browse menu items. They can view detailed information of each product, customize and add items to their cart, place orders, and view their order history. Additionally, users can also track the live status of their active orders.

On the employee side, staff can view incoming customer orders and update the progress status of each order, such as preparing, completed, or delayed. This allows customers to see the status of their orders in real time within the application.

The application will also implement touch gestures to improve user interaction. For example, customers may swipe left on an item in the cart to delete it. Employees may swipe right on an order to update its progress status, such as marking the order as preparing or completed.

Services / APIs

Local database (SQLite)

- To store user account information and login credentials.
- To store menu items including item categories, descriptions, prices, and images.
- To store active cart data such as selected item modifications, sizes, and quantities.
- To store customer orders, order history, and live order status updates.

Touch Gestures

- To improve the overall usability and interaction of the mobile application.
- To handle swipe-left movements of customers on cart items to delete them.
- To handle swipe-right movements of customers to easily open and change the details of an item already in their cart, such as changing the size, adding modifications, or updating the quantity.
- To handle swipe-left movements of employees to quickly update their progress status to Delayed.
- To handle swipe-right movements of employees to quickly update a customer's order status through their standard preparation steps (Pending, Preparing, Ready for Pickup, Completed).
- To handle long-press gestures of customers on menu items for a quick preview of the product image and description.

Functions

Function	Description
Customer Side	
Register	The user must first register an account before accessing the other features of the app. Users are required to provide their full name, birthday, email, contact number, and password.

Log-in	The user must log in before placing orders or viewing their order history. This requires the user to enter their registered email and password.
View Menu	The customer can view all available beverages, snacks, and desserts offered by the coffee shop. Menu items are displayed with their corresponding prices, images, and names.
View Product Details	Selecting a menu item displays additional details such as the product description, ingredients, available sizes, and final pricing.
Filter Menu	The customer can filter menu items according to category such as coffee, non-coffee, snacks, or desserts.
Add to Cart	The customer can select products and add them to their shopping cart before completing their purchase.
Update Cart Quantity	The customer can increase or decrease the quantity of items in the cart.
Remove Item from Cart (Swipe Left)	The customer can swipe left on an item in the cart to remove it from the cart.
Edit Item from Cart (Swipe Right)	The customer can swipe right on an item in the cart to edit details of the item such as selected size, add-ons, and quantity.
View Cart	The customer can review all selected products before placing an order.
Place Order	The customer can submit an order and save the transaction to the local database.
View Current Order Status	The customer can track the progress of active orders (Pending, Preparing, Ready for Pickup, Completed, Delayed).
View Order History	The customer can view previously completed orders, including order details and transaction amounts.
View Profile	The customer can view their account information.
Log-out	The customer can securely log out of the application.
Employee Side	
Employee Log-in	Employees must log in using their assigned credentials to access the employee dashboard.
View Incoming Orders	Employees can view all newly placed customer orders.
View Order Details	Employees can view detailed information about an order, including items ordered and customer information.
Update Order Status	Employees can update order progress statuses such as Pending, Preparing, Ready for Pickup, Completed, or Delayed.

Update Order Status (Swipe Left)	Employees can swipe left on an order to quickly update its status to Delayed.
Update Order Status (Swipe Right)	Employees can swipe right on an order to quickly update its status, updating the order to the next sequential status such as Preparing to Ready for Pickup.
View Active Orders	Employees can view all orders that are currently in progress.
View Completed Orders	Employees can view orders that have already been completed.
View Delayed Orders	Employees can view orders marked as delayed.
Manage Menu Items	Employees can add, edit, or remove menu items from the application.
Update Product Availability	Employees can mark menu items as available or unavailable.
View Customer Order History	Employees can review customer purchase records when necessary.
View Dashboard Summary	Employees can view summary information such as total orders, active orders, and completed orders.
Employee Log-out	Employees can securely log out of the application.
